

UV Dye

Vapco's super concentrated UV Dye formula is designed to find any and all leaks in HVACR systems. Ideal in both residential and commercial systems; UV Dye is great for preventative maintenance programs, and highlighting leaks as they form for easy detection and repair.

Like all Vapco's Direct inject products, UV Dye has been designed to atomize and travel with the refrigerant already in the system. It is compatible with all refrigerants and oils, so it will not negatively impact the lubricity or viscosity of the system and can be left in the system to continuously search for leaks. Just scan the system after installation with a UV lamp and florescence enhancing glasses, and any leaks will shine brightly. Don't worry if you don't have them, Vapco's UV Dye is so bright that glasses and UV lamps are often not needed to find the leaks!

Vapco's UV Dye is the easiest to install in the industry. Single dose tubes are available in multiple sizes for any job. The easy to use direct inject tube can be put in through many means and no special tools are needed. Inject UV Dye with refrigerant, from high side to low side with gauges, or use one of our designated Direct Inject Tools. Most leaks can be found minutes after installation, but some commercial systems might take a few hours for the dye to completely circulate and locate the leaks.

Save time and money from conventional and costly leak detection methods. Don't waste time with messy pouring or trying to plunge in other inferior dyes. Find UV Dye by itself, or with our industry leading refrigeration seal in Seal and Dye, Tech in a Tube, and Kitchen Sink with UV Dye. No leak can hide from Vapco's ultra-bright UV dye.

Key Features

- Saves time and money versus conventional methods
- Pinpoints exact spots leak has formed
- Not harmful to compressors, gauges, TXV's or cap tubes
